14th JAI, Barcelona, October 2nd, 2014

F. Mocholí

Introduction

- From 60s, Environmental control has been growing.
- Water is widely controled.
- Air control is so spread and analytical methods are old and not renewed
- EPA, NIOSH, OSHA and ASTM methods are compound specific and sorbent dependant, ex:
 - ◆ NIOSH 2500 for 2-Butanone (MEK), sorbent: Carboxen 564
 - ◆ OSHA 111 for Toluene, sorbent: coconut charcoal or Carbosieve SIII (Anasorb 747)

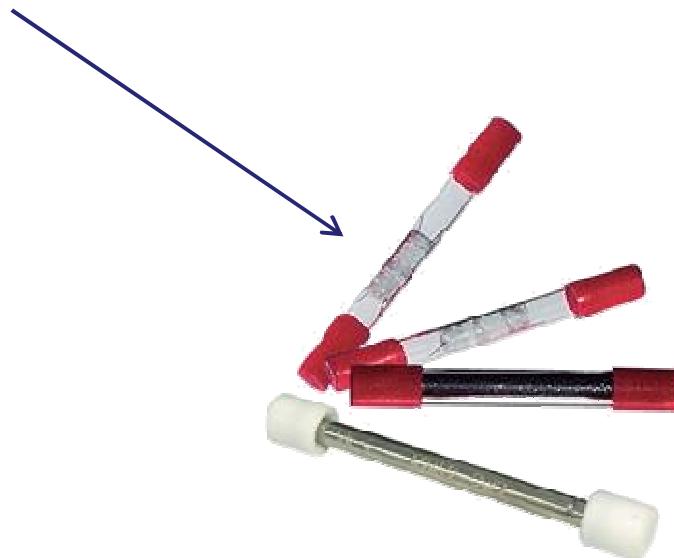

Overview

- Optimization of a generic method to analyze volatile compounds in indoor air for:
 - ◆ Qualitative identification of a broad range of compounds in air to identify odor sources
 - and
 - ◆ Quantitation of selected compounds in air to determine the global sample odor
- Both approaches done on the same analysis
- Systematization of data interpretation to give odor source interpretation
 - ◆ Odor Units
 - ◆ Discomfort calculation
- Complete problem diagnosis

Available Techniques

- Direct air sampling with (Tedlar) bag
- Absorption tube
- SPME

Conclusions

- SPME with dynamic adsorption is a proven technique to monitor Volatile Organic Compounds (VOCs) in air.
- Constant flow and total volume are the most important parameters to make results reproducible.
- Identification (qualitative) and quantitation are available approaches to give good results in indoor air analysis.
- Interpretation is possible by calculating Odor Units (UO), to correlate actual odor measurements and Nocive Units (UEP)
